Making Your Own Stethoscope (Experiential Learning Activity)

"Tell me and I forget, teach me and I may remember, involve me and I learn."

-Benjamin Franklin

These words indeed came to life on the **8th of November 2023**, as an Experiential Learning Activity of **making your own stethoscope** was conducted for our eager, enthusiastic young learners of class-I. The volunteers distributed the kit to the children, which kickstarted their level of excitement. A total of 91 students from class I participated in this programme. A stethoscope is a medical device that has attracted every child when they have visited a doctor and the thought of wearing it around the neck and hearing their heartbeat was a dream come true.

Like all Experiential Learning Activities, the children learnt in a holistic manner. From how a stethoscope works, to making one with their own hands. This involved their complete participation with good use of mind and body coordination. The instructions given were carefully followed by all our creative minds. The children joined the transparent tubes provided and learned the importance of breathing correctly. The information was also shared with the students on how one must keep our environment clean so that we can breathe in fresh air, a blessing to our lungs. It was a sheer delight to watch the bright stars at work and knowing that the masterpiece could be taken home, their joy had no bounds. This was an activity that surely did give our children new ambitions and motivated them to follow their dreams.

As rightly said – ***"Every day is a chance to learn."***
